## Fall 2007

# Biology 70, Lecture 4, Part I

## Fall 2007

more common fate

13

from lecture outline: TEMPORAL PHENOMENA

- 1. How might the cortex signal direction of motion?
- 2. What is the explanation of the waterfall effect?
- 3. What is "common fate" in regard to detecting form from motion?
- 4. What is the flicker-fusion rate?

14

from lecture outline: DEPTH

- 5. In the real world what are clues which the brain uses to determine depth?
- 6. What are Julesz patterns and what do they show about depth perception?

15

monocular clues : perspective, size, occlusion, and height in picture

16

depth, monocular clue: shadow

17

depth, binocular clues: convergence and accommodation

18

# Biology 70, Lecture 4, Part I

## Fall 2007

BAD JOKE !!

19

depth, binocular clue: disparity

20

depth, binocular clue: disparity

21

disparity

22

more disparity

Fig. 11.18. Binocular disparity. The square and circle are imaged quite close together on the right retina, but are imaged considerably farther apart on the left retina. If observer fixates on square, there must be a disparity in the retinal locations of the image of the circle.

23

Julesz patterns: depth with disparity as only clue

24

# Biology 70, Lecture 4, Part I

## Fall 2007

### construction of Julesz patterns

Figure 7-21. The random dot stereogram invented by Julesz. The two halves of the stereogram are identical except that a central portion of one half is shifted toward one side, as illustrated in the accompanying letter matrices.

25

### construction of Julesz patterns

26

### views for differing eyes

27
