## Homework \#6 Problems (\#36-40)

In this problem set (and in the remainder of Chemistry 163B), you may use the differential expressions for the state functions $\mathrm{U}, \mathrm{H}, \mathrm{A}$, and G as 'given' starting points.
36. E\&R P6.20 [differs from P6.20 2nd

Calculate $\Delta \mathrm{G}$ for the isothermal expansion of 2.25 mol of an ideal gas at 325 K from an initial pressure of12.0 bar to a final pressure of 2.5 bar.
also calculate $\Delta A$ for the same expansion.
37. E\&R P6.5 [same as P6.5 2nd
38. E\&R P6.26 [same as P6.26]
39. Consider the equilibrium between two complementary DNA oligomer strands and the doubled-stranded duplex in the 'two-state' approximation.

$$
\mathrm{S}+\mathrm{S}^{\prime} \rightleftarrows \mathrm{D} \text { (S-S' duplex) }
$$

a. Write $\mathrm{K}_{\text {eq }}$ for the above equilibrium in terms of the concentrations [S], [S'], and [D].
b. One measure of the stability of DNA and RNA oligomers is melting temperature, $T_{m}$, defined as the temperature at which $50 \%$ of the oligomer and its complement are in a doubled-stranded (duplex) configuration and $50 \%$ in a single stranded. Thus at $\mathrm{T}_{\mathrm{m}}$, there are equal amounts of oligomer strands in D and in $\mathrm{S}+\mathrm{S}^{\prime}: 2[\mathrm{D}]=[\mathrm{S}]+\left[\mathrm{S}^{\prime}\right]$. If the single strands are mixed in equal initial concentrations with $\mathrm{C}_{\mathrm{T}}=\left[\mathrm{S}_{0}{ }_{0}+\left[\mathrm{S}^{\prime}\right]_{0}=2[\mathrm{~S}]_{0}\right.$, write an expression for the equilibrium constant at $\mathrm{T}_{\mathrm{m}}$, in terms of only $\mathrm{C}_{\mathrm{T}}$.
c. Write an expression for $T_{m}$ in terms of $\Delta H^{\circ}$ and $\Delta S^{\circ}$ for duplex formation and $\mathrm{C}_{\mathrm{T}}$.
d. It is found that $\Delta \mathrm{H}^{\circ}$ and $\Delta \mathrm{S}^{\circ}$ for this process can be well estimated by considering the interactions between nearest-neighbor base-pairs on $S$ with their complement on S' [see "A unified view of polymer, dumbbell, and oligonucleotide DNA nearest-neighbor thermodynamics", Proc. Natl. Acad. Sci. USA Vol. 95, pp. 1460-1465, 1998].

| Base <br> pairs <br> (NN) | $\Delta \mathrm{H}^{\circ}$ <br> $\mathrm{kJ} \mathrm{mol}^{-1}$ | $\Delta \mathrm{S}^{\circ}$ <br> $\mathrm{JK}^{-1} \mathrm{~mol}^{-1}$ |
| :---: | :---: | :---: |
| AA/TT | -33.05 | -92.88 |
| AT/TA | -30.12 | -85.35 |
| TA/AT | -30.12 | -89.11 |
| CA/GT | -35.56 | -94.97 |
| GT/CA | -35.14 | -93.72 |
| GA/CT | -34.31 | -92.88 |
| CG/GC | -44.35 | -113.81 |
| GC/CG | -41.00 | -102.09 |
| GG/CC | -33.47 | -83.26 |
| G-C init | 0.41 | -11.72 |
| A-T init | 9.62 | 17.15 |

Using the table above estimate, $\Delta \mathrm{H}^{\circ}, \Delta \mathrm{S}^{\circ}$, and $\mathrm{T}_{\mathrm{m}}$ for the two hexamer duplexes (for $\mathrm{T}_{\mathrm{m}}$, use $\mathrm{C}_{\mathrm{T}}=$ $10^{-3} \mathrm{M}$ ):
i. $5^{\prime}$ CGTTGA3'

3'GCAACT5'
With NN (nearest neighbor) interactions:
$\mathrm{NN}=(\mathrm{G}-\mathrm{C})_{\text {initiation }}+\mathrm{CG} / \mathrm{GC}^{+} \mathrm{GT} / \mathrm{CA}^{+}+\mathrm{AA} / \mathrm{TT}^{+} \mathrm{CA} / \mathrm{GT}^{+}+\mathrm{GA} / \mathrm{CT}^{+(\mathrm{A}-\mathrm{T})_{\text {initiation }}}$
ii. *(optional)

5'AATTAA3'
3'TTAATT5'
With NN (nearest neighbor) interactions:

$$
\mathrm{NN}=2(\mathrm{~A}-\mathrm{T})_{\text {initiation }}+3 \mathrm{AA} / \mathrm{TT}+\mathrm{AT} / \mathrm{TA}+\mathrm{TA} / \mathrm{AT}
$$

An automated program for calculating general oligonucleotide interactions can be accessed at: http://www.idtdna.com/analyzer/Applications/OligoAnalyzer/ [needs cookies!] The ANALYZE function on this site is setup to run oligomers that bind to very dilute DNA sequences. To use this site is for part d. i and ii, you would enter the appropriate sequence, set Target Type=DNA, set Oligo Conc $=250 \mu \mathrm{M}$ and set $\mathrm{Na}+$ conc $=1000 \mathrm{mM}$, then click ANALYZE to get MELT TEMP. Although this site purports to use the same PNAS parameters as above, you will get slightly different $T_{m}$ 's.
[Literature reference: SantaLucia, J, PNAS, 95, 1460-1465 (1998)]
40. The deamination of aspartic acid:

is a reversible reaction catalyzed by the enzyme aspartase. For D,L-aspartic acid the equilibrium constant as function of temperature can be expressed by the equation:
$\log K_{D, L}=8.188-\frac{a}{T}-b T$ where $\mathrm{a}=2315.5 \mathrm{~K}$ and $\mathrm{b}=0.01025 \mathrm{~K}^{-1}$
a. What is $\Delta \mathrm{G}^{\circ}$ at $25^{\circ} \mathrm{C}$ ? (in $\mathrm{kJ} \mathrm{mol}^{-1}$ )
b. Derive an equation for $\Delta \mathrm{H}^{\circ}$ as a function of T . (in $\mathrm{kJ} \mathrm{mol}^{-1}$ )
c. What is $\Delta \mathrm{H}^{\circ}$ at $25^{\circ} \mathrm{C}$ ? (in $\mathrm{kJ} \mathrm{mol}^{-1}$ )
d. What is $\Delta \mathrm{S}^{\circ}$ at $25^{\circ} \mathrm{C}$ ? (in $\mathrm{JK}^{-1} \mathrm{~mol}^{-1}$ )
e. * (optional) How are $\Delta \mathrm{H}$ and $\Delta \mathrm{C}_{\mathrm{p}}$ related? Use this relationship to obtain $\Delta \mathrm{C}_{\mathrm{p}}{ }^{\circ}$ at $25^{\circ} \mathrm{C}$ for the deamination of aspartic acid.
