Review Topics Weeks 4-5

In reviewing material one should not memorize the entries as 'plug-in' formulas. But should understand i) how they arise from the basic laws of thermodynamics; ii) what are the limits on their generality and under what special conditions they apply; and iii) how they qualitatively reflect the 'logic' of the natural world and, in some cases, the underlying properties of molecules and matter.

- Statements of the Second Law of Thermodynamics
 - Macroscopic properties of an <u>isolated system</u> eventually assume constant values (e.g. pressure in two bulbs of gas_becomes constant; two block of metal reach same T) [*Andrews.* p37]
 - It is impossible to construct a device that operates in cycles and that converts heat into work without producing some other change in the surroundings. *Kelvin's Statement [Raff p 157]; Carnot Cycle*
 - It is impossible to have a natural process which produces no other effect than absorption of heat from a colder body and discharge of heat to a warmer body. *Clausius's Statement, refrigerator*
 - In the neighborhood of any prescribed initial state there are states which cannot be reached by any adiabatic process
 Caratheodory's statement [Andrews p. 58]
 - ~ Caralneodory's statement [Andrews p. 56]
- Important statements regarding entropy and statistical disorder
 - Greater number of microstates, greater disorder
 - Each allowed microstate is equally probable
 - the overwhelming number of microstates correspond to macrostates with almost identical macroscopic properties
 - W, the number of microstates corresponding to the macrostate, is a measure of the DISORDER of the system in that macrostate
 - A system "meanders" through all available microstates; but you are only likely to observe it in one of the overwhelming number that correspond to the equilibrium macrostate
 - W, the number of microstates corresponding to the macrostate, depends on the populations of various energy levels
 - Adiabatic, reversible, work changes the energy of system but not the populations of the energy levels (the disorder, W)
 - Reversible heat transfers change the populations of the energy levels (and thus W)
- Carnot engines (reversible, $q_H > 0$ at T_H ; $q_L < 0$ at T_L ; $w_t < 0$)
 - Demonstration of machine consistent with 2nd Law (i.e. in a cyclic process, heat can be converted to work if and only if heat is returned to surroundings at a lower temperature.

$$\circ \qquad \varepsilon = \frac{-w_t}{q_H} = 1 - \frac{T_L}{T_H}$$

。 Reverse process corresponds to refrigerators and heat pumps

$$\circ \qquad \sum \frac{q}{T} = \frac{q_H}{T_H} + \frac{q_L}{T_L} = 0$$

- $_\circ~~\epsilon$ of any Carnot engine ('any working substance") has the same dependence on T_H and T_L
- Any reversible cyclic process can be describes as a sum of (infinitesimal) Carnot cycles, thus the properties of any cyclic process are combinations of those of Carnot cycles
- Thermal properties of entropy and entropy calculations

$$dS = \frac{dq_{rev}}{T}; \quad \Delta S = \int \frac{dq_{rev}}{T}; \quad \oint \frac{dq_{rev}}{T} = 0$$

$$\Delta S \ge \int \frac{dq}{T}; \quad 0 \ge \oint \frac{dq}{T}; \quad (= for \ reversible \ process; > for \ spontaneous \ ['real'] \ process)$$

$$\circ \quad \Delta S_{\textit{total=universe}} = \Delta S_{\textit{system}} + \Delta S_{\textit{surroundings}} \ge 0$$

- S is a state function; *d*S is an exact differential
- Dependence of S on

•
$$T: \left(\frac{\partial \overline{S}}{\partial T}\right)_{V} = \frac{\overline{C}_{V}}{T}; \quad \left(\frac{\partial \overline{S}}{\partial T}\right)_{P} = \frac{\overline{C}_{P}}{T}$$

• $P: \left(\frac{\partial \overline{S}}{\partial P}\right)_{T} = -\left(\frac{\partial \overline{V}}{\partial T}\right)_{P}$

• V:
$$\left(\frac{\partial \overline{S}}{\partial \overline{V}}\right)_T = \left(\frac{\partial P}{\partial T}\right)_{\overline{V}}$$

• Phase:
$$\Delta S = \frac{\Delta H_{equilibrium phase change}}{T_{equilibrium phase change}}$$

- Calculation of entropy changes for changes in P, V, T, phase
- Third Law and calculations using Third Law Entropies: $\overline{S}^{o}(T)$

$$\circ \quad \Delta S^{0}_{reaction}(T) = \sum_{i} v_{i} \overline{S}^{0}_{i}(T)$$

- Entropy of mixing: $\Delta S = -n_{total} R \sum_{i} X_{i} \ln X_{i}$ where $X_{i} = \frac{n_{i}}{n_{total}}$
- Qualitative assessment of factors affecting $\overline{S}(T, P, V)$ and $\Delta S_{reaction}$

- Derivation of various thermodynamic relationships
 - mathematical tools
 - properties of exact differentials
 - "dividing through" by 'd?"
 - Euler-Maxwell relationships
 - state functions
 - U=q+w
 - H≡U+PV
 - A≡U-TS
 - G≡H-TS

- o and their total differentials (no work other, closed systems)
 - TdS = \vec{d} q TdS= \vec{d} q_{rev} (P_{ext})_{rev}=P_{int}=P
 - dU = TdS PdV U(S,V) internal energy
 - dH = TdS + VdP H(S,P) enthalpy
 - dA = -SdT PdV A(T,V) Helmholtz free energy
 - dG = -SdT + VdP G(T,P) Gibbs free energy
