"rules" of science

- observations

- guiding principles

- predictions and applications based on principles

4

4

Slide 5

Observations (QM vs Thermo)

Thermodynamics is very 'working class' in its origins:

quantum mechanics   thermodynamics

Effete   **Blue Collar**

$H \, \Psi = E \, \Psi$ $\Delta S_{universe} > 0$

5

5

Slide 6

observations: thermo ≡ heat

- Count Rumford, 1799
- observed water turning into steam when canon barrel was bored
- *work ⇔ heat*

FIGURE 11. An illustration from Rumford's paper, "An Inquiry Concerning the Source of the Heat Which is Excited by Friction," showing the apparatus used by him in the cannon boring experiment. Figure 1, upper left, shows the cannon as received from the foundry, and Figure 2, below, shows it mounted in the machine used for boring. (Reproduced with the permission of Harvard University Press.)

(1st and 2nd laws)

8

"Applications"   U,H,S,G

How does knowledge about efficiencies of steam engines, mechanical systems, etc, relate to processes in chemical, biological, and geological systems?
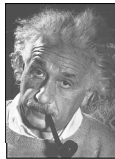

ANSWERED BY:

J. W. Gibbs- arguably the frist great American scientist who combined the concepts of heat and entropy and proposed "[Gibbs] Free Energy", **G**, a thermodynamic state function that leads to a whole spectrum of applications

9

---

from: Einstein's "Autobiographical Notes"

A theory is the more impressive the greater the simplicity of its premises, the more different kinds of things it relates, and the more extended its area of applicability. Hence the deep impression that classical thermodynamics made upon me. It is the only physical theory of universal content concerning which I am convinced that, within the framework of the applicability of its basic concepts, it will never be overthrown (for the special attention of those who are skeptics on principle).

10

---

types of problems that thermodynamics addresses (reactions)

might

1. Under what conditions will a reaction occur ?

   EXAMPLE:
   C (graphite) → C (diamond) 1 atm 398K   *nada*

   30,000 -100,000 atm   *¡Hurra!*
   1000 K – 3000 K
   1st artificially produced diamonds, 1954 at General Electric Labs

11

---

types of problems that thermodynamics addresses (equilibria)
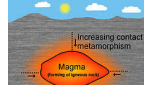

2. How far will a reaction proceed (given enough time)?
   How do the thermal and entropic properties determine EQUILIBRIUM ?
   How do the EQUILIBRIUM conditions depend on T,P ?

$N_2 (g) + 3H_2 (g) \leftrightharpoons 2NH_3 (g)$

what are best T,P for NH_3 products?

The Haber Process

$SiO_2 + CaCO_3 \leftrightharpoons CaO \cdot SiO_2 + CO_2 (g)$
quartz   calcite   wollastonite

geologic thermometer:
The fraction of wollastonite in a rock sample can be used to estimate the temperature at which the rock metamorphosis occurred [the T at which the equilibrium was rapidly frozen]

Geologic Thermometer

12

Slide 13

types of problems that thermodynamics addresses (biology)
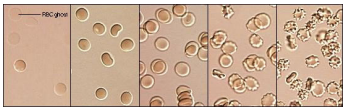

3. Chemical and physical changes in biological systems

$[K^+]$ *inside* $\rightarrow$ $[K+]$ *outside*

cell

what difference in $[K^+]_{out}$ vs $[K^+]_{in}$ can be tolerated before cell wall bursts or collapses?

| *low hypotonic (rupture)* | *extracellular salt* | **normal isotonic** | *extracellular salt* | *high hypertonic (collapse)* |

http://www.vivo.colostate.edu/hbooks/cmb/cells/pmemb/osmosis.html

13

Slide 14

types of problems that thermodynamics addresses (biology)

4. Why does an egg hard boil? (protein conformation)

Uncooked Proteins   Cooked proteins network

5. Membrane potentials and ion concentrations in neurons. (electrochemistry and thermodynamics)

Cytosol | Extracellular
Membrane

Distribution of electrical charge across the membrane. The uneven charges inside and outside the neuron line up along the membrane because of electrostatic attraction across this very thin barrier.

14

Slide 15

*types of problems that thermodynamics addresses (ecology)*

6. Thermodynamic feasibility of SO_2 removal

$$SO_2 (g) \leftrightarrows S(s) + O_2 (g)$$

http://healthandenergy.com/images/magnitka%20smoke%20stacks.jpg

15

Slide 16

what thermodynamics can't answer

1. How fast a reaction proceeds (kinetics, catalysts, enzymes; in chem 103, BMB 100, chem 163C)

2. Macroscopic thermodynamics does not prove or require hypotheses about molecular structure; however we will use our knowledge of molecular structure to get an atomic "picture" of thermodynamic processes. The quantitative connection is made by statistical thermodynamics:

   chem 163A $\Leftrightarrow$ chem 163B
   chem 163C

3. Although in chemistry 163B we will study how thermodynamics put limits on processes at equilibrium, there exists a whole other field of *non-equilibrium thermodynamics*.

16

Slide 17

aims of class

1. Clear conceptual picture of thermodynamics

2. Ability to relate and apply thermodynamics to chemical and biological systems

3. **PROBLEM SOLVING: Chemistry + Logic + Mathematics**

4. How to do independent and advanced reading/research in areas that utilize thermodynamics.

5. THE GRAND PICTURE of how thermodynamics and quantum mechanics fit into our picture of 'nature'.

6. Advanced mathematical techniques

Winter 2020 — Chemistry 163B

Tutorial Tuesday 7th January
Homework Problems
(#1-#8)

1. For an ideal gas $P\bar{V} = RT$ $\left(\bar{V} \equiv V_m = \dfrac{V}{n}\right.$ molar volume$)$ evaluate:

   a. $\left(\dfrac{\partial P}{\partial \bar{V}}\right)_T$ b. $\left(\dfrac{\partial \bar{V}}{\partial T}\right)_P$

   c. $\left(\dfrac{\partial T}{\partial P}\right)_{\bar{V}}$ d. $\left(\dfrac{\partial P}{\partial \bar{V}}\right)_T \left(\dfrac{\partial \bar{V}}{\partial T}\right)_P \left(\dfrac{\partial T}{\partial P}\right)_{\bar{V}}$

2. For a Van der Waals gas: $\left(P + \dfrac{a}{\bar{V}^2}\right)(\bar{V} - b) = RT$ evaluate:

   a. $\left(\dfrac{\partial P}{\partial \bar{V}}\right)_T$ b. $\left(\dfrac{\partial^2 P}{\partial \bar{V}^2}\right)_T$

   c. $\left(\dfrac{\partial P}{\partial T}\right)_{\bar{V}}$ d. $\left[\dfrac{\partial}{\partial T}\left(\dfrac{\partial P}{\partial \bar{V}}\right)_T\right]_{\bar{V}}$

   e. $\left[\dfrac{\partial}{\partial \bar{V}}\left(\dfrac{\partial P}{\partial T}\right)_{\bar{V}}\right]_T$

21

Slide 22

Winter 2020 — Chemistry 163B

3. Engel & Reid problem P1.38 (4th edition)

to HW#1 listing on CANVAS

Van der Waals gas

4. (optional) The Van der Waals and virial expressions are two commonly used equations of state as approximations to real gas behavior:

$$P = \frac{RT}{(\bar{V} - b)} - \frac{a}{\bar{V}^2} \quad \text{Van der Waals}$$

$$P = RT\left[\frac{C_1(T)}{\bar{V}} + \frac{C_2(T)}{\bar{V}^2} + \frac{C_3(T)}{\bar{V}^3} + \frac{C_4(T)}{\bar{V}^4} + \cdots\right] \quad \text{virial}$$

a. Show that the first three virial coefficients are related to the Van der Waals parameters a and b in the following way:

$C_1(T) = 1$
$C_2(T) = b - a/RT$
$C_3(T) = b^2$

HINT:
note that the virial expansion is just a Taylor (Maclaurin) series in $z^k = \left(\dfrac{1}{\bar{V}}\right)^k$

$$\frac{P}{RT} = \sum_{k=0}^{\infty} C_k(T)\left(\frac{1}{\bar{V}}\right)^k = \sum_{k=0}^{\infty} C_k(T) z^k = f(z;T)$$

$$\text{with coefficient } C_k(T) = \frac{1}{k!}\left(\frac{d^k f}{dz^k}\right)_{z=0}$$

b. Why does the Van der Waals "a" only appear in $C_2(T)$?

our thermodynamics trek

23

Slide 24
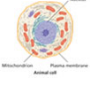

system and surroundings (careful definitions) E&R$_{4th}$ sec 1.3

A thermodynamic **system** consists of all the materials involved in the process under study. This material could be the contents of an open beaker containing reagents, the electrolyte solution within an electrochemical cell, or the contents of a cylinder and movable piston assembly in an engine.

In thermodynamics, the rest of the universe is referred to as the **surroundings**.

system + surroundings = the **UNIVERSE**

If a system can exchange matter with the surroundings, it is called an **open system**; if not, it is a **closed system**.

24

Ideal Gas Energy: Game Plan Handout #6 ➡ *[E&R pp 7-8]$_{4th}$*

for monatomic ideal gas

from PV=n*kT and P=F/A

⬇

use physics to relate pressure ⇔ energy of gas

⬇

show E$=\dfrac{3}{2}n^*kT$ (n* atoms gas) or E$=\dfrac{3}{2}nRT$ (n moles gas)

and thus for monatomic ideal gas E depends only on T !!!
[*in thermodynamic notation E ≡ U (internal energy)*]

27

27

---

heuristic *derivation of E=E(T) for ideal gas [U=U(T)] E&R pp.7-8$_{4th}$* ➡

RESULT: for ('monatomic') ideal gas
(how) **energy depends only on temperature**

28

28

---

heuristic derivation

1. molecules all with same |v$_x$| (all same v$_x$ is 'heuristic')

2. elastic collision with wall velocity of mass goes v$_x \rightarrow -$v$_x$

3. from physics $P = \dfrac{F}{A}$ P=pressure

4. from physics $F = \dfrac{dp}{dt}$ p=mv, momentum; t=time

5. dp $\approx \Delta$p = 2m v$_x$ per collision (m is mass of particle)

6. total Δp in given time Δt, $\left(\dfrac{\Delta p}{\Delta t}\right) \approx \left(\dfrac{dp}{dt}\right)$

would depend on number of collisions in that interval

29

29

---

heuristic derivation

7.

30

30

Slide 31

heuristic derivation

8. $\dfrac{n^*}{V}$ is density of molecules, $\mathbf{A}v_x\Delta t = V$ is volume of rectangular box,

9. $\dfrac{1}{2}\dfrac{n^*}{V}Av_x\Delta t$ is total number of molecules colliding with area A in Δt

10. total $\Delta p = \left(2mv_x\right)\left(\dfrac{1}{2}\right)\left(\dfrac{n^*}{V}\right)\left(Av_x\Delta t\right) = \left(mv_x^2\right)\left(\dfrac{n^*}{V}\right)\left(A\Delta t\right)$

31

Slide 32

heuristic derivation

11. after some algebra and equating

$$P = \dfrac{F}{A} = \dfrac{\Delta p}{A\Delta t} = \left(mv_x^2\right)\left(\dfrac{n^*}{V}\right) = \dfrac{n^* kT}{V}$$

$$P = \left(mv_x^2\right)\left(\dfrac{n^*}{V}\right) = \left(\dfrac{n^*}{V}\right)\dfrac{kT}{2}$$

$$\left(\dfrac{mv_x^2}{2}\right) = \dfrac{kT}{2} \quad \text{for each molecule of 1-D ideal gas}$$

12. in 3D with $|v_x| = |v_y| = |v_z|$

$$\text{total KE} = \left(\dfrac{1}{2}mv_x^2 + \dfrac{1}{2}mv_y^2 + \dfrac{1}{2}mv_z^2\right)n^* = \dfrac{3}{2}n^* kT = \dfrac{3}{2}nRT$$

$\dfrac{1}{2}RT$ for each degree (x,y,z) of 'classical freedom'

32

Slide 33

TAKE HOME MESSAGES

- Good warm up of physics and equation derivation

- For a molecule with only kinetic energy (e.g. monatomic species), and ideal gas (no intermolecular forces)

$$E = \dfrac{3}{2}kT \text{ per molecule or } E = \dfrac{3}{2}RT \text{ per mole}$$

- **For monatomic ideal gas, E is function of only T**;

T constant ⇔ E constant

Equation of State	Functional Form		Number of Parameters
Ideal gas	$PV_m = RT$	HW#1 1	0
van der Waals	$(V_m - b)(P + a/V_m^2) = RT$	HW#1 2-3	2
Dieterici	$P(V_m - b)\exp[a/RTV_m] = RT$		2
Berthelot	$(V_m - b)(P + a/TV_m^2) = RT$		2
Virial	$P = RT\left[V_m^{-1} + \sum_{n=2}^{\infty} C_n(T)V_m^{-n}\right]$	HW#1 *4	∞
Beattie–Bridgman	$PV_m^2 = (1 - \gamma)RT(V_m + \beta) - \alpha$, with $\gamma = c_n/T^3V_m$, $\beta = b_n[1 - b/V_m]$, and $\alpha = a_n[1 + a/V_m]$		5
Redlich–Kwong	$P = \dfrac{RT}{(V_m - b)} - \dfrac{a}{T^{1/2}V_m(V_m + b)}$		2
Reichsanstalt	$PV = RT + AP + BP^2 + CP^3 + \cdots$.		∞

35

Slide 36

Some comments on the

Van der Waals equation of state

36

ES2   Eugene Switkes, 1/6/2020

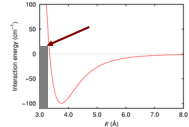

Slide 37

van der Waals equation the parameter b

ideal gas law $\quad P_{ideal} \quad \bar{V}_{ideal} = RT$

van der Waals $\quad \left(P + \dfrac{a}{\bar{V}^2} \right)\left(\bar{V} - b \right) = RT$

interpretation of parameters:

b is correction for actual volume of atoms/molecules

- volume available to molecules $\left(\bar{V} - b \right)$ smaller than $\bar{V}$
- b is associated with repulsive forces

37

Slide 38

van der Waals equation the parameter a

$$P_{ideal} \quad \bar{V}_{ideal} = RT$$

$$\left(P + \dfrac{a}{\bar{V}^2} \right)\left(\bar{V} - b \right) = RT$$
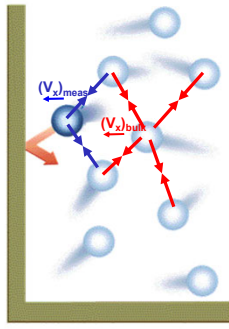

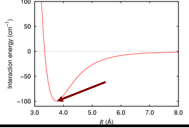

interpretation of parameters:

a is correction for attractive forces of atoms/molecules

- a is associated with attractive forces
- $P_{bulk} \equiv P_{ideal}$ is greater than $P \equiv P_{meas}$ measured at surface
- $P_{bulk} = \left(P_{meas} + \dfrac{a}{\bar{V}^2} \right) \quad P_{meas} \to P_{bulk} \quad \bar{V} \to \infty$

38

Slide 39

heuristic justification for attractive constant a

- asymmetric attractive forces for molecule at surface
- molecule at surface has less momentum less than molecule in bulk
- $P \equiv P_{meas} < P_{bulk}$
- $P_{bulk} = \left(P + \dfrac{a}{\bar{V}^2} \right)$
  $\Uparrow$
  P_{meas}

$(V_x)_{meas}$
$(V_x)_{bulk}$

Slide 46

The Haber Process (thermodynamics and kinetics)

Previously the problem had been that N_2 is a very stable molecule, and so most attempts to convert it to less stable molecules, such as NH_3, failed because of thermodynamic or entropy problems. The secret to the Haber-Bosch process proved to be a catalyst of iron with a small amount of aluminium added (aluminium was at the time an exotic and expensive metal that probably attracted Haber's attention as a novelty). The Haber-Bosch process operates at high pressure so as to shift the equilibrium to the right, and high temperature to increase the rates of the reaction. Of course, operating at high temperature actually shifted the reaction to the left, but the trade-off for faster rates was accepted. By removing the ammonia as liquid ammonia, the equilibrium is continuously shifted to the right.
