

$$\begin{aligned} \text{activity coefficients for ions (HW8 #56)} \\ & \mathcal{B}aCl_2(s) \rightleftharpoons Ba^{2*}(aq) + 2Cl^{-}(aq) \\ & \mathcal{L}_{S_{S}} = \frac{\left(a_{Ba^{2*}(aq)}\right)\left(a_{CT^{-}(aq)}\right)^2}{\left(a_{BaCl_2(s)}\right)} \\ & a_{BaCl_2(s)} = 1 \\ & a_{BaCl_2(s)} = \gamma_{Ba^{2*}}\left[Ba^{2*}\right] \\ & a_{CT^{-}(aq)} = \gamma_{CT^{-}}\left[CT^{-}\right] \end{aligned}$$

$$\begin{aligned} \text{cannot determine } \gamma_{Ba^{2*}} \text{ and } \gamma_{CT^{-}} \text{ independently} \\ \text{but only } \gamma_{Ba^{2*}} = \gamma_{CT^{-}} = \gamma_{\pm} \quad \left(\gamma_{\pm} = \gamma_{\pm}\right) \\ & \mathcal{L}_{S_{S}} = \frac{\left(\gamma \pm 1\right)^3}{1} \frac{\left(\left[Ba^{2*}\right]/1M\right)\left(\left[CT^{-}\right]/1M\right)^2}{\left(1\right)} \\ & \mathcal{L}_{S_{S}} = (\gamma \pm 1)^3 \left[Ba^{2*}\right]\left[CT^{-}\right]^2 \end{aligned}$$

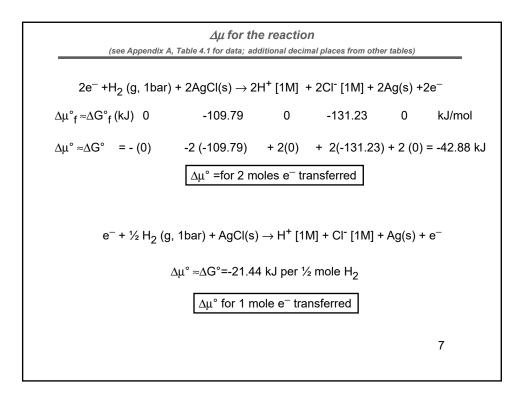

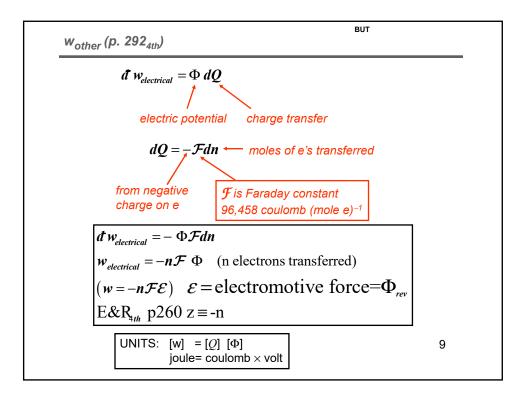

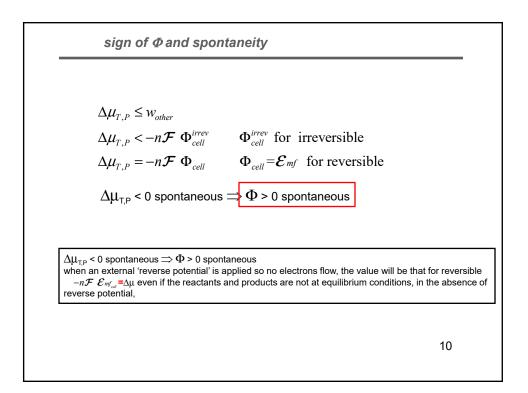

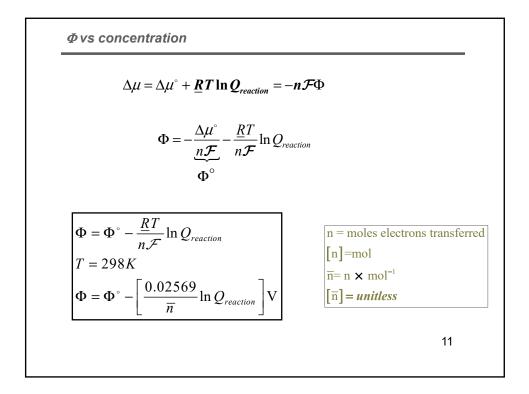

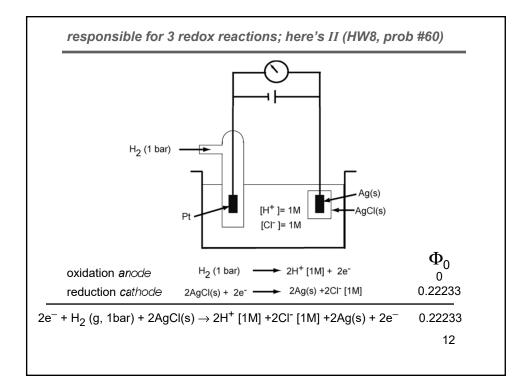

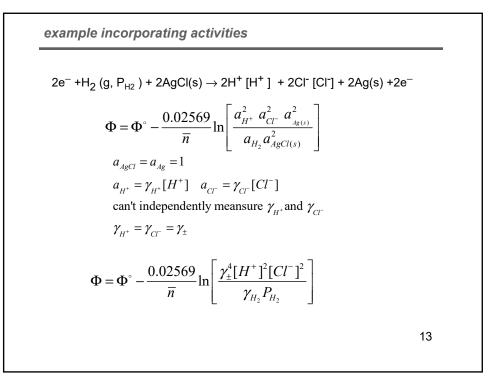

Table 2.1 Types of Work				
ypes of Work	Variables, System definition	Equation for System-Based Work	SI Units	
las expansion nd compression	Pressure in the surroundings at the system– surroundings boundary ( $P_{ext}$ ), volume (V) The gas is the system.	$-\int_{V_i}^{V_f} P_{\text{ext}}  dV$	$\mathrm{Pa}\mathrm{m}^3=\mathrm{J}$	
pring stretching and ompression	Force ( <b>F</b> ), distance ( <b>x</b> ) The spring is the system.	$w = \int_{x_i}^{x_f} \mathbf{F} \cdot d\mathbf{x}$	Nm=J	
Bubble expansion and ontraction	Surface tension $(\gamma)$ , surface area $(\sigma)$ The content of the bubble is the system.	$w = -\int_{\sigma_i}^{\sigma_j} \gamma d\sigma$	$(N\ m^{-1})\ (m^2)=J$	
Current passes hrough conductor	Electrical potential difference ( $\phi$ ), electrical charge ( $Q$ ) The conductor is the system.	$w = \int_{0}^{Q} \phi  dQ'$	V C = J	
	The conductor is the system.			

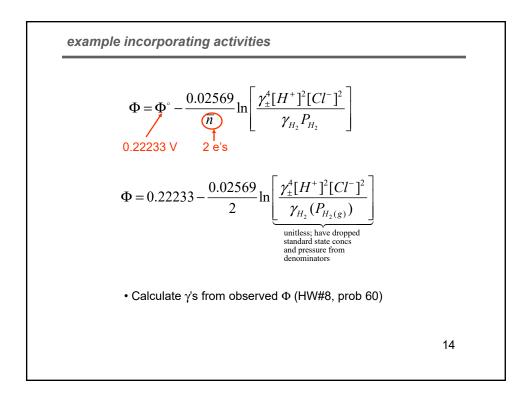

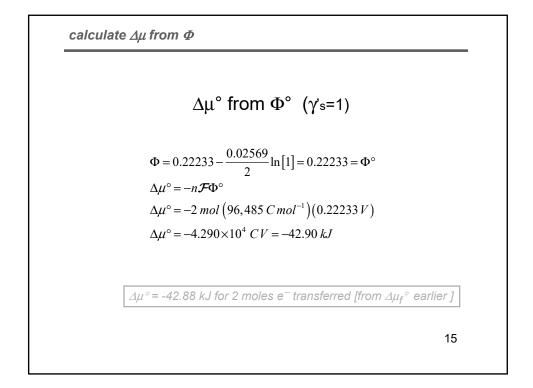

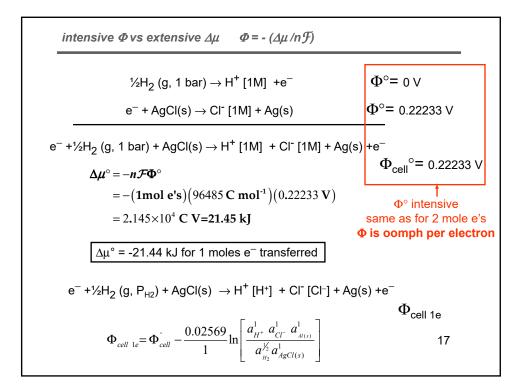

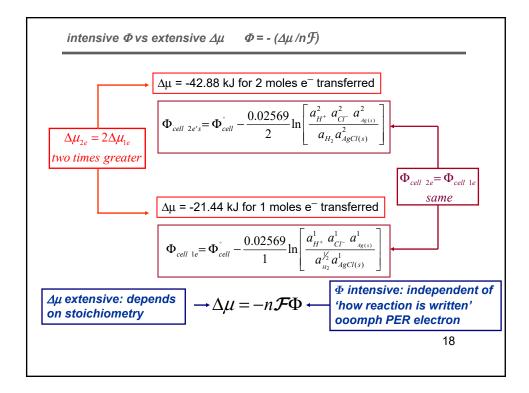

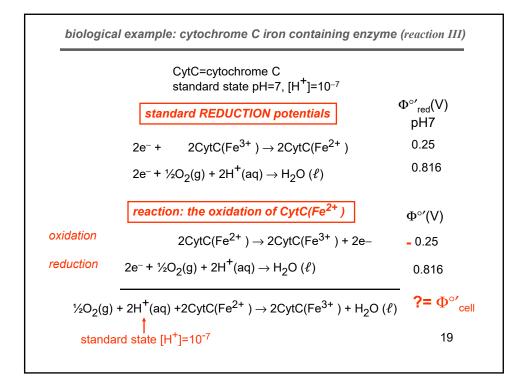

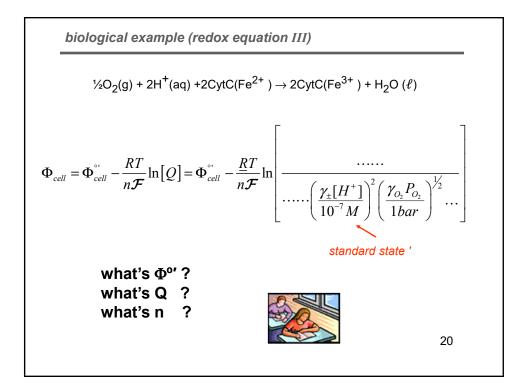

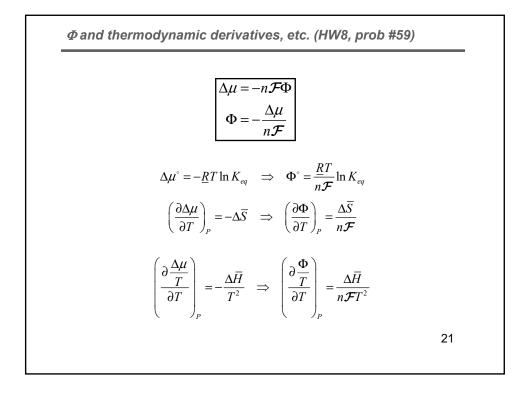

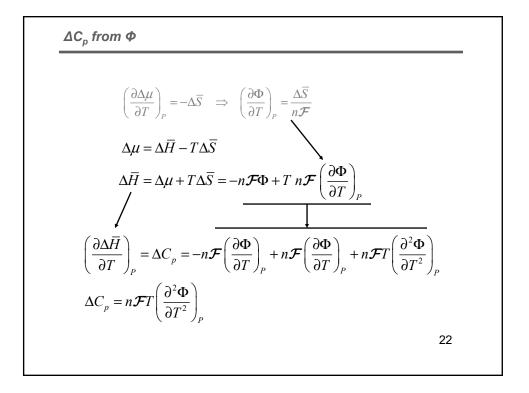

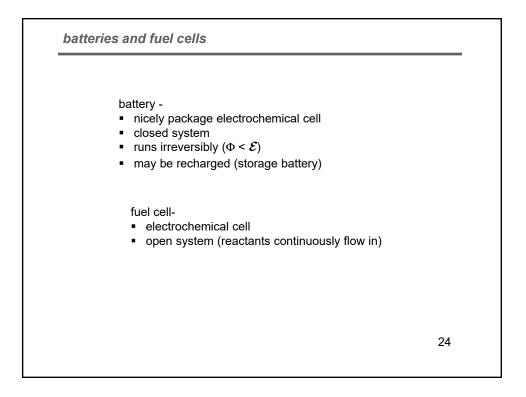

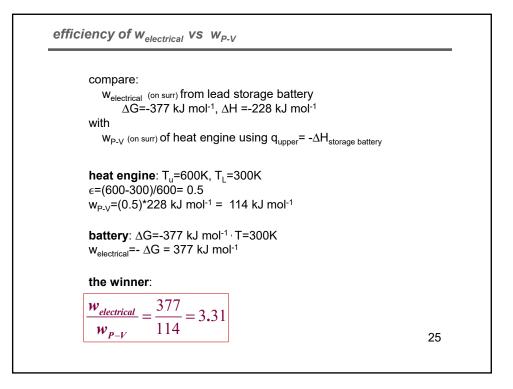

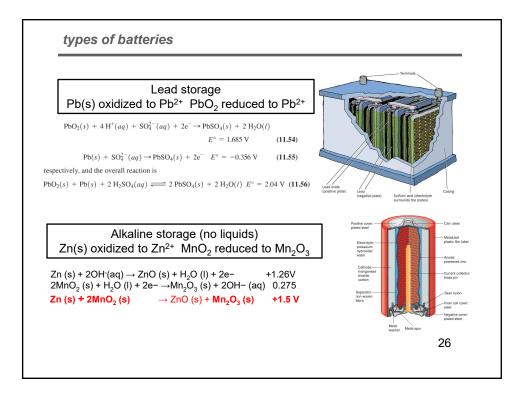

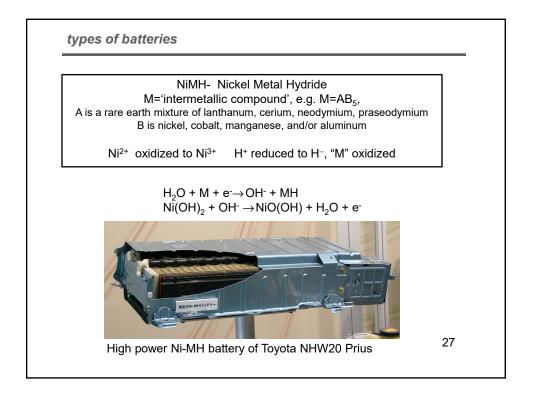

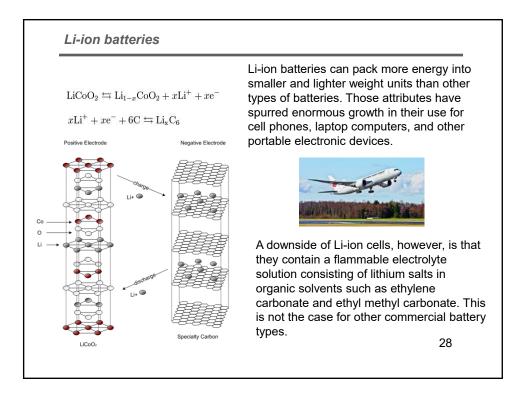

Elements the set of t

Zinc	1.5V	<b>Non-rechargeable</b> –first the forerunner and later an inexpensive alternative to Alkaline batteries. However, reductions in the price of Alkalines have made both Zinc-Carbon and Zinc-Chloride batteries all but obsolete.	
Alkaline	1.5V	Rechargeable– Alkaline rechargeable batteries are lower capacity (don't hold a charge as long) than the more popular NiMH rechargeables. The advantage of the rechargeable Alkaline over th NiMH or the NiCAD is that it loses its charge gradually,	
Nickel-Metal Hydride (NiMH)	1.25V	Rechargeable- Lightweight and rechargeable, the NiMH has a higher capacity than the NiCAD plus you can throw it away since it doesn't contain toxic metals and it isn't classed as a hazardous was item.	
Lithium ion	3.6V	Rechargeable– For a given voltage, a lithium ion battery is smaller size and lighter in weight than a nickel cadmium (NiCd) or nickel metal hydride (NiMH) battery. In addition, lithium ion has virtually no self-discharge. This allows a lithium ion battery to be stored for months without losing charge. The battery chemistries can be compared as follows:
