

*Crown 85: Visual Perception:
A Window to Brain and Behavior*

Lecture 1: Neurons and How They Communicate

brain factoids (from: [University of Washington](#))

<u>weight of human brain</u>	1300-1400 g (3 lbs)
neurons in brain	100 x 10 ⁹
length of neurons	less than 1mm greater than 1m (spinal cord to foot)
speed of electrical transmission	0.5 m/sec 120 m/sec (268 mi/hr)

3

the language of the brain is ??? **electricity**

**Your brain is electric.
It generates 10 to 12 watts of electricity –
enough to power a flashlight.**

http://www.morphonix.com/software/education/science/brain/game/specimens/electric_brain.html

4

5

Prelude to Lectures on Visual Perception

6

Today:

the Neuron and
Electrical Potentials

7

different regions of the brain are associated with specific behaviors

The Functions of the Human Brain

© 2001 HowStuffWorks

8

Thursday:

Neuroanatomy

Prof/Provost Camps

how does one investigate brain activity and the correlated behavior ??

next Tuesday:

techniques of
neuroscience research

11

12

the class objectives:

- **Gain a basic understanding of**
 - ✓ neurons and how they communicate
 - ✓ structure of the brain
 - ✓ techniques used to investigate brain function

- *In order to understand (in some detail)*
 - VISION: How the eye and brain**
 - ✓ capture the properties of brightness, form, and color from the outside world
 - ✓ change light to electrical signals
 - ✓ extract and process visual information
 - ✓ enable visual behavior (the perception of form, color, depth, motion, illusion)

13

the objectives (continued):

- So that **YOU** can read and **REPORT** on contemporary topics in Brain and Behavior

e.g.

- ✓ Neuroscience and the Law
- ✓ Neuroscience and magic
- ✓ Neuroscience and art
- ✓ Neurotransmitters and drugs
- ✓ Visual development and amblyopia
- ✓ Mindreading
- ✓ Yadda
- ✓ Yadda
- ✓ Yadda

14

the obligations:

moi:

- organize and ~PRESENT material on vision and brain
- appropriate for SI requirement (*and hopefully interesting*)

you:

- class participation and **OFFICE HOURS**
- midterm on vision and brain lectures
- short class (oral) report on assigned lecture subtopic
- interview with UCSC neuroscientist and class report on interview
- capstone research project and report

15

Crown 85 Winter 2016

Visual Perception: A Window to Brain and Behavior

Lecture 1- Neurons, Synapses, Neurotransmitters, Action Potentials

16

anatomy of a neuron

1. Be able to identify the following morphological features of the neuron and to describe the role they play in receiving and transmitting neural impulses.

- ✓ a. neuron
- b. cell body (soma)
- c. dendrite
- d. axon
- e. axon hillock
- f. presynaptic bulb (axon terminal)
- g. synapse
- h. myelin sheath
- i. node of Ranvier

This magnified image shows two neurons. The nerve fibre of one neuron links to the cell body of the other.
<http://www.aviva.co.uk/health-insurance/home-of-health/medical-centre/medical-encyclopedia/entry/structure-and-function-nerve-cells/>

17

anatomy of a neuron

1. Be able to identify the following morphological features of the neuron and to describe the role they play in receiving and transmitting neural impulses.

- ✓ a. neuron
- ✓ b. cell body (soma)
- c. dendrite
- d. axon
- e. axon hillock
- f. presynaptic bulb (axon terminal)
- g. synapse
- h. myelin sheath
- i. node of Ranvier

The cell wall is a lipid bilayer membrane which separates the intracellular fluid from the extracellular space.

<http://fourier.eng.hmc.edu/e180/lectures/signal1/node2.html>

18

anatomy of a neuron

1. Be able to identify the following morphological features of the neuron and to describe the role they play in receiving and transmitting neural impulses.

- ✓ a. neuron
- ✓ b. cell body (soma)
- ✓ c. dendrite
- ✓ d. axon
- e. axon hillock
- ✓ f. presynaptic bulb (axon terminal)
- g. synapse
- ✓ h. myelin sheath
- ✓ i. node of Ranvier

<http://hubpages.com/education/Structure-of-a-Neuron>

19

anatomy of a neuron

1. Be able to identify the following morphological features of the neuron and to describe the role they play in receiving and transmitting neural impulses.

- ✓ a. neuron
- ✓ b. cell body (soma)
- ✓ c. dendrite
- ✓ d. axon
- ✓ e. axon hillock
- ✓ f. presynaptic bulb (axon terminal)
- g. synapse
- ✓ h. myelin sheath
- ✓ i. node of Ranvier

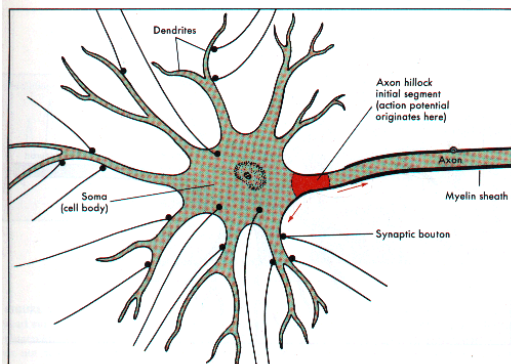

FIGURE 4-6 A spinal motor neuron with multiple synapses on both soma and dendrites. The axon hillock-initial segment has the lowest threshold, and as a result, action potentials tend to originate here.

http://www.apsbiology.org/anatomy/2010/2010_Exam_Reviews/Exam_3_Review/CH_11_Histology_of_the_Neurons_Axon.htm

20

anatomy of a neuron

1. Be able to identify the following morphological features of the neuron and to describe the role they play in receiving and transmitting neural impulses.

- ✓ a. neuron
- ✓ b. cell body (soma)
- ✓ c. dendrite
- ✓ d. axon
- ✓ e. axon hillock
- ✓ f. presynaptic bulb (axon terminal)
- ✓ g. synapse
- ✓ h. myelin sheath
- ✓ i. node of Ranvier

Where an axon terminal makes a functional connection, or synapse, with another cell is called a postsynaptic cell. If the postsynaptic cell is another neuron then the synapse is normally made with a dendrite or the cell body of a postsynaptic neuron. In the most common synapse there is a tiny space, called the synaptic cleft, this separates the axon terminals from the postsynaptic cell.

<https://jordan-tesch.wikispaces.com/Chapter+four>

21

functions of parts of a neuron

1. Be able to identify the following morphological features of the neuron and to describe the role they play in receiving and transmitting neural impulses.

- a. neuron
- b. cell body (soma)
- c. dendrite
- d. axon
- e. axon hillock
- f. presynaptic bulb (axon terminal)
- g. synapse
- h. myelin sheath
- i. node of Ranvier

23

summary

1. Be able to identify the following morphological features of the neuron and to describe the role they play in receiving and transmitting neural impulses.

- a. neuron
- b. cell body (soma)
- c. dendrite
- d. axon
- e. axon hillock
- f. presynaptic bulb (axon terminal)
- g. synapse
- h. myelin sheath
- i. node of Ranvier

24

understand the basic functioning of the neural action potential

2. Understand the basic functioning of the neural action potential and be familiar with the following terms and concepts:
 - a. ion concentrations inside and outside the neuron (how do they give rise to the membrane potential ?)
 - b. resting potential
 - c. depolarization and hyperpolarization
 - d. action potential

25

understand the basic functioning of the neural action potential

2. Understand the basic functioning of the neural action potential and be familiar with the following terms and concepts:
 - a. **ion concentrations inside and outside the neuron (how do they give rise to the membrane potential ?)**
 - b. **resting potential**

Simple Picture

1. ion concentrations, $[K^+]$, $[Na^+]$, $[Cl^-]$, $[A^-]$ differ between intracellular and extracellular fluids
2. in resting state cell membrane is permeable only to $[K^+]$ (slightly permeable through 'leak' channels)
3. $[K^+]_i$ **high inside** diffuses (*only a little*) to $[K^+]_o$ **low outside** (Cl^- and other $-$ don't go along !!)
4. leaves net $-$ *inside* $\approx -70mV =$ **resting potential**

26

understand the basic functioning of the neural action potential

2. Understand the basic functioning of the neural action potential and be familiar with the following terms and concepts:
 - a. ion concentrations inside and outside the neuron (how do they give rise to the membrane potential ?)
 - b. resting potential

<http://classes.midlandstech.edu/carterp/Courses/bio210/chap03/lecture1.htm>

27

more: understand the basic functioning of the neural action potential

2. Understand the basic functioning of the neural action potential and be familiar with the following terms and concepts:
 - a. ion concentrations inside and outside the neuron (how do they give rise to the membrane potential ?)
 - b. resting potential

28

understand the basic functioning of the neural action potential

2. Understand the basic functioning of the neural action potential and be familiar with the following terms and concepts:
 - a. ion concentrations inside and outside the neuron (how do they give rise to the membrane potential ?)
 - b. resting potential

c. depolarization and hyperpolarization

- **depolarization:** membrane potential becomes more positive
if sufficiently large will create an action potential (suprathreshold)
or may be insufficiently large (subthreshold depolarization)

- **hyperpolarization:** membrane potential becomes more negative
can 'counteract' (i.e. cancel, sum with) depolarization but in itself will not lead to action potential

29

neural action potential

2. Understand the basic functioning of the neural action potential and be familiar with the following terms and concepts:

c. action potential (or 'spike')

<https://faculty.washington.edu/chudler/flash/son1.html>

http://ep.yimg.com/ca/!yhst-31600583429934_2260_31723678

30

action potential

- Understand the basic functioning of the neural action potential and be familiar with the following terms and concepts:

c. action potential (or 'spike')

Simple Picture

- Neuron is at resting potential only K⁺ leakage channels open
-70mV

http://bioserv.fiu.edu/~walterm/Fund_Sp2004/nervous/sp06_exam2_nervous_review.htm

31

neural action potential

- Understand the basic functioning of the neural action potential and be familiar with the following terms and concepts:

c. action potential

Simple Picture

- Depolarizing input (e.g. synaptic transmission) opens local Na⁺ 'voltage gated' channels. Na⁺ ions flow in **depolarizing** the neuron (less negative voltage)
- If local depolarization reaches a threshold ($\approx -55\text{mV}$) **neuron fully depolarizes ('spikes')** to a fixed level ($\approx +40\text{mV}$)

http://bioserv.fiu.edu/~walterm/Fund_Sp2004/nervous/sp06_exam2_nervous_review.htm

32

action potential

2. Understand the basic functioning of the neural action potential and be familiar with the following terms and concepts:

c. action potential. d. refractory period

Simple Picture

http://bioserv.fiu.edu/~walterm/Fund_Sp2004/nervous/sp06_exam2_nervous_review.htm

4. The K⁺ 'voltage gated' channels then open . K⁺ ions flow out [re]hyperpolarizing the neuron, returning to the resting potential
5. The return to the resting potential and 'recovery' of the voltage-gated Na⁺ channels requires a ≈ 3-4ms refractory period during which the neuron can not 'fire' again

33

action potential animation (Werblin, UCB)

other resources for action potential propagation

https://mcb.berkeley.edu/courses/mcb64/action_potential.html

<https://mcb.berkeley.edu/courses/mcb64/propagation.html>

Animation 2.3: The Action Potential

In order to study how action potentials are generated, we will first insert two electrodes into the neuron: one to record the membrane voltage, and another to inject current that can be used to push the membrane voltage toward more positive (depolarizing) or more negative (hyperpolarizing) voltages.

<http://sites.sinauer.com/neuroscience5e/animations02.03.html>

37

summary of membrane and action potentials

2. Understand the basic functioning of the neural membrane and action potentials and be familiar with the following terms and concepts:
 - a. ion concentrations inside and outside the neuron (how do they give rise to the membrane resting potential ?)

$[Na^+]_{inside} < [Na^+]_{outside}$; $[K^+]_{inside} > [K^+]_{outside}$; $[Cl^-]$ and $[A^-]$ proteins and other negative ions **balance +charges**

- b. resting potential

at 'rest' only $[K^+]$ 'leaks' inside \implies outside ; leaving - ions inside with -70mV resting potential

- c. depolarization and hyperpolarization

depolarization: membrane potential becomes more positive
hyperpolarization: membrane potential becomes more negative

- d. action potential

$[Na^+]$ rushes inside \longleftarrow outside causing a spike of depolarization (increase of membrane potential to $\approx +40mV$)

- e. refractory period

3-4 msec period after action potential where neuron is unresponsive to further polarizing input

- f. propagation of action potential

local action potential opens adjacent Na^+ voltage-gated channels and spike of depolarization moves down axon

38

communication among neurons (passing the message along !!)

3. Understand the role each of the following plays in the transmission of electrical signals (information) between neurons
 - a. neurotransmitter
 - b. synaptic vesicle
 - c. synaptic cleft
 - d. postsynaptic receptor
 - e. excitatory and inhibitory synaptic transmission

39

the structure of the synapse

- a. neurotransmitter
- b. synaptic vesicle
- c. synaptic cleft
- d. postsynaptic receptor

http://www.apsbiology.org/anatomy/2010/2010_Exam_Reviews/Exam_3_Review/CH_11_Histology_of_the_Neurons_Axon.htm

40

animation of synaptic transmission

<https://mcb.berkeley.edu/courses/mcb64/synapse.html>

41

synaptic transmission (simple picture)

- action potential comes down presynaptic axon causing synaptic vesicles to migrate towards presynaptic membrane
- vesicles fuse with presynaptic membrane and release neurotransmitter
- neurotransmitter travels through synaptic cleft to postsynaptic receptors
- interaction of neurotransmitter with postsynaptic receptor causes
 - depolarization of postsynaptic membrane (**excitatory synapse**)
 - or
 - hyperpolarization of postsynaptic membrane (**inhibitory synapse**)

42

excitatory vs inhibitory synapses

Excitatory and Inhibitory Neurotransmitters

<http://faculty.southwest.tn.edu/rburkett/A&P1%20Muscle%20Physiology.htm>

- **EXCITATORY SYNAPSE:**
release of some neurotransmitters results in **depolarization** of postsynaptic neuron (e.g. epinephrine, glutamate)
- **INHIBITORY SYNAPSE:**
release of other neurotransmitters results in **hyperpolarization** in postsynaptic neuron (e.g. GABA, glycine)
- In addition to the neurotransmitter the nature of the postsynaptic receptors can determine whether a synapse is excitatory or inhibitory

43

communication among neurons (passing the message along !!)

3. Understand the role each of the following plays in the transmission of electrical signals (information) between neurons

- ✓ a. neurotransmitter chemicals released from synapse that cause postsynaptic neuron to depolarize or hyperpolarize
- ✓ b. synaptic vesicle 'containers' holding neurotransmitters in presynaptic bulb
- ✓ c. synaptic cleft
- ✓ d. postsynaptic receptor interaction of neurotransmitter with receptor results in depolarization or hyperpolarization of postsynaptic dendrite
- ✓ e. excitatory and inhibitory synaptic transmission

	excitatory synapse (+)		Inhibitory synapse (-)	
presynaptic	depolarizing	hyperpolarizing	depolarizing	hyperpolarizing
postsynaptic	depolarizing	hyperpolarizing	hyperpolarizing	depolarizing

44

neurotransmitters

4. “Recognize” the names of the major neurotransmitters and their primary ‘effect’
- acetylcholine [Ach]
 - norepinephrine (noradrenaline) [NE,NAd]
 - dopamine [DA]
 - serotonin (5-hydroxytryptamine) [5-HT]
 - GABA (gamma-aminobutyric acid)

45

common neurotransmitters

Table 11.1 Actions of Common Neurotransmitters

Neurotransmitter	Sites Where Released	Principal Actions
Acetylcholine	Brain Neuromuscular junctions Autonomic nervous system	Excitatory on skeletal muscles Excitatory or inhibitory on internal organs
Norepinephrine	Areas of brain and spinal cord Autonomic nervous system	Excitatory or inhibitory, depending on receptors Plays a role in emotions
Serotonin	Areas of brain Spinal cord	Usually inhibitory Involved in moods, sleep cycle, appetite
Dopamine	Areas of brain Parts of peripheral nervous system	Excitatory or inhibitory, depending on receptors Plays a role in emotions
Glutamate	Areas of brain Spinal cord	Usually excitatory Major excitatory neurotransmitter in brain
Endorphins	Many areas in brain Spinal cord	Usually inhibitory Natural opiates that inhibit pain
Gamma-aminobutyric acid	Areas of brain Spinal cord	Usually inhibitory Principal inhibitory neurotransmitter in brain
Somatostatin	Areas of brain Pancreas	Usually inhibitory Inhibits release of growth hormone

4. “Recognize” the names of the major neurotransmitters and their primary ‘effect’

- ✓ a. acetylcholine [Ach] neuron to muscle excitatory
- ✓ b. norepinephrine (noradrenaline) [NE, NAD]
- ✓ c. dopamine [DA] excitatory or inhibitory, role in emotions
- ✓ d. serotonin (5-hydroxytryptamine) [5-HT] inhibitory, role in moods
- ✓ e. glutamate primary excitatory transmitter in brain
- ✓ f. GABA (gamma-aminobutyric acid) primary inhibitory transmitter in brain

how a neuron integrates and signals information

5. Understand the following properties of a neuron's response
 - a. Summation of excitation and inhibition
 - b. Stimulus strength versus firing rate

49

integration of neuronal signals

Signal summation at the axon hillock

A single neuron can receive both excitatory and inhibitory inputs from multiple neurons. All these inputs are added together at the axon hillock. If the EPSPs are strong enough to overcome the IPSPs and reach the threshold of excitation, the neuron will fire.

<https://www.boundless.com/biology/textbooks/boundless-biology-textbook/the-nervous-system-35/how-neurons-communicate-200/signal-summation-764-11997/>

50

how a neuron integrates and signals information

53

overview

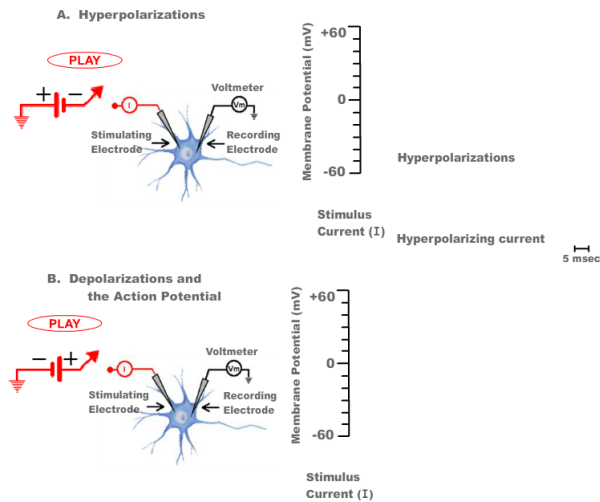

hhmi | **BioInteractive**

<http://www.hhmi.org/biointeractive/molecular-mechanism-synaptic-function>

54

hyperpolarization and depolarization (<http://neuroscience.uth.tmc.edu/s1/chapter01.html>) figure 1.3

© 2000 UTHSCH

55

hyperpolarization and depolarization

'take home' implications:

- as hyperpolarizing stimulus increases, neuron become more hyperpolarized as "graded" potentials; NO ACTION POTENTIALS
- as depolarizing stimulus increases subthreshold "graded" depolarization increases until threshold is reached and an action potential is generated

56

spike properties vs strength of input (<http://neuroscience.uth.tmc.edu/s1/chapter01.html>) figure 1.4

57

spike rate vs intensity of stimulation

what could the 'stimulus' be :

- inputs from other neurons via dendrites that are summed at axon hillock
- inputs from 'sensory transduction'
- input from an artificial electrode (pictured)

what is observed:

- stimulus too small \Rightarrow subthreshold depolarization
- weak stimulus \Rightarrow one spike
- medium stimulus \Rightarrow moderate spike rate
- strong stimulus \Rightarrow high spike rate

'take home' implications:

- very weak stimuli that do not cause neuron to reach threshold will not lead to action potentials
- amplitude of action potential depolarization is fixed, does not depend on strength of stimulus
- strength of suprathreshold stimuli coded in firing-rate of neuron
strong stimulus \Rightarrow many spikes per second weak stimulus \Rightarrow few spikes per second

58

combining excitatory and inhibitory signals <http://neuroscience.uth.tmc.edu/s1/introduction.html>

<http://neuroscience.uth.tmc.edu/s1/introduction.html> figure 5

59

combining excitatory and inhibitory signals

take home message:

- action potentials in presynaptic neuron at excitatory synapse will depolarize postsynaptic neuron with resulting postsynaptic spikes (if excitation is above threshold)
- action potentials in presynaptic neuron at inhibitory synapse will hyperpolarize postsynaptic neuron
- if excitation and inhibition arrive sufficiently simultaneously, they will cancel in postsynaptic neuron

CRWN 85 - 01 Visual Perception: A Window to Brain and Behavior [COURSE MATERIALS](#)

2016 Winter Quarter

Class Details		Status
Career	Undergraduate	<input checked="" type="checkbox"/> Closed
Grading	Student Option	Available Seats 0
Class Number	43179	Enrollment Capacity 25
Type	Lecture	Enrolled 25
Credits	5 units	Wait List Capacity 0

General Education SI

Scientific Inquiry (SI code)—One course required (5 credits)

One five-credit course or equivalent is required that focuses on the essential roles of observation, hypothesis, experimentation and measurement in the sciences.

Description
Investigates visual perception as an example of the correlation of brain and behavior. Uses a multidisciplinary analysis of the optical, biochemical, and neural components of the visual pathway leading to the perception of form, color, etc. Discusses the applications of neuroscience in the social sciences, the humanities, engineering, and the arts.

Enrollment Requirements
Enrollment is restricted to students in the Crown College or Cowell College first-year honors program.
